**Physical Layer, OAM, Provider Bridges...**
- **IETF**  
**MPLS, VPLS, Traffic Engineering...**

# IEEE 802.3ah Updates

# IEEE 802.3ah projects

Cisco.com

- **Copper**
  - Line coding for EoVDSL**
- **EPON**
  - New protocol to extend MAC functionality for point to multipoint (or PON) topology**
  - Concerns about cost, security**
- **OAM**
  - For remote subscriber management, OAM in frames vs OAM in preamble. OAM for 10GBASE- links**
- **Optics**
  - Defining and standardizing specs for extended temp. operation –40 to +85 Celsius case temp.**

# IEEE 802.3ah – Physical layer Specifications

Cisco.com

- **10PASS-TS**

  - Symmetrical min 10 Mbps

  - Point-to-point topology

  - $\geq 750$  m on voice grade copper cable

  - DMT line code chosen

  - Supports PSTN in baseband

- **2BASE-TL**

  - Symmetrical min 2Mbps

  - Point-to-point topology

  - $\geq 2700$  m on voice grade copper cable

  - Higher speed with bonding

# IEEE 802.3ah – Physical Layer Specifications cont.

Cisco.com

- **100BASE-LX10/BX10 & 1000BASE-LX10/BX10**  
Up to 10 km over SMF  
Point-to-point topology
- **1000BASE-PX10/20 (PON)**  
Point-to-Multipoint topology  
Up to 10 or 20 km with 1:16 splits on SMF

# IEEE 802.3ah – Ethernet in the First Mile

Cisco.com

- **Ethernet Standard for the First Mile Access Network**

**EFM Copper for the last 750 to 2700 meters**

**10 Megabit and 2 Megabit Ethernet over local loop copper**

**Hybrid deployment with EFM fiber supports a flexible variety of access network topologies (greenfield and legacy)**

# IEEE 802.3ah - OAM Objectives

- **OAM provides mechanisms to:**
  - Monitor link operation and health**
  - Improve fault isolation**
- **Method: OAM data conveyed in basic (*untagged*) 802.3 Slow Protocol frames**
  - Sent between two ends of a single link**
  - Slow Protocols will allow S/W implementation**
- **Fills major requirement to reduce EFM OpEx**

# IEEE 802.3ah - OAM Non-objectives

Cisco.com

- Does **not** provide capabilities for:

Station management

Protection switching

Provisioning

***No SET functions***

Bandwidth allocation

Speed/duplex negotiation

End-to-end OAM communication

***802.3 scope restricted to single links***

# IEEE 802.3ah - OAM Forwarding

- **Can only traverse a single link**  
Not forwarded by bridges
- **Communication beyond a single link left to higher layers**

# OAM Critical Link Events

- **Link Fault**

Signal remote device that receive path is broken

**Sent only once per second in Information OAMPDU**

- **Dying Gasp**

Signal remote device that unrecoverable local fault (e.g. power failure) has occurred

May be sent immediately/continuously

- **Critical Event**

An unspecified critical event has occurred

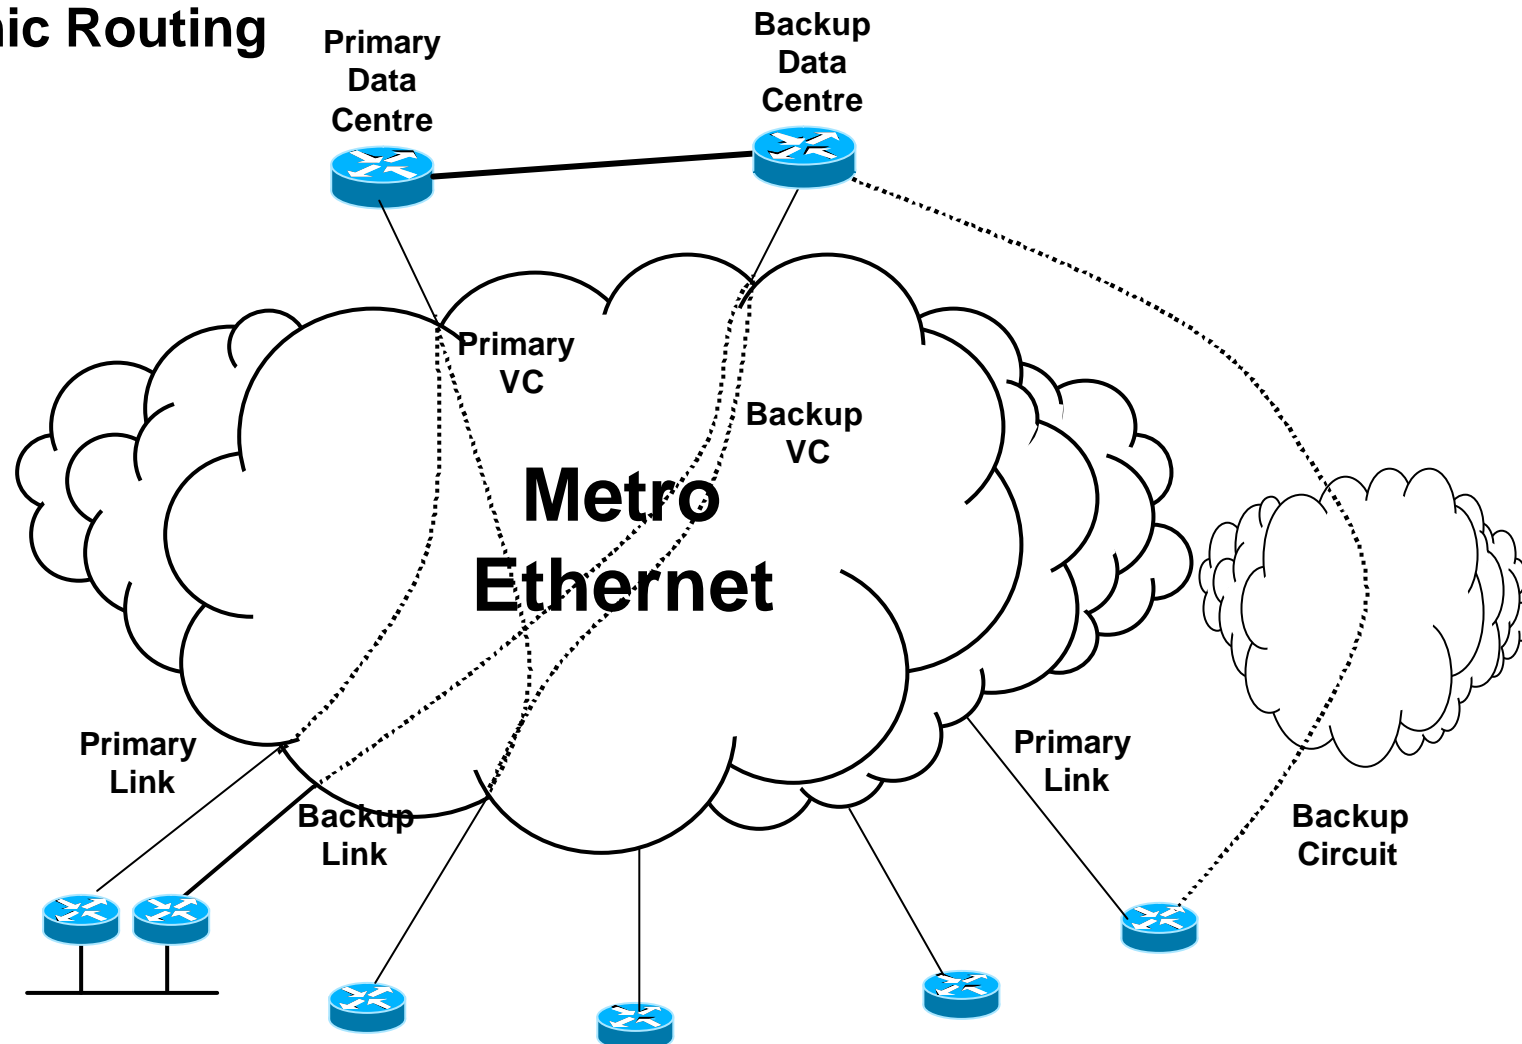

May be sent immediately/continuously

**New as of D2.1**

# Hub & Spoke Architecture – With redundancy

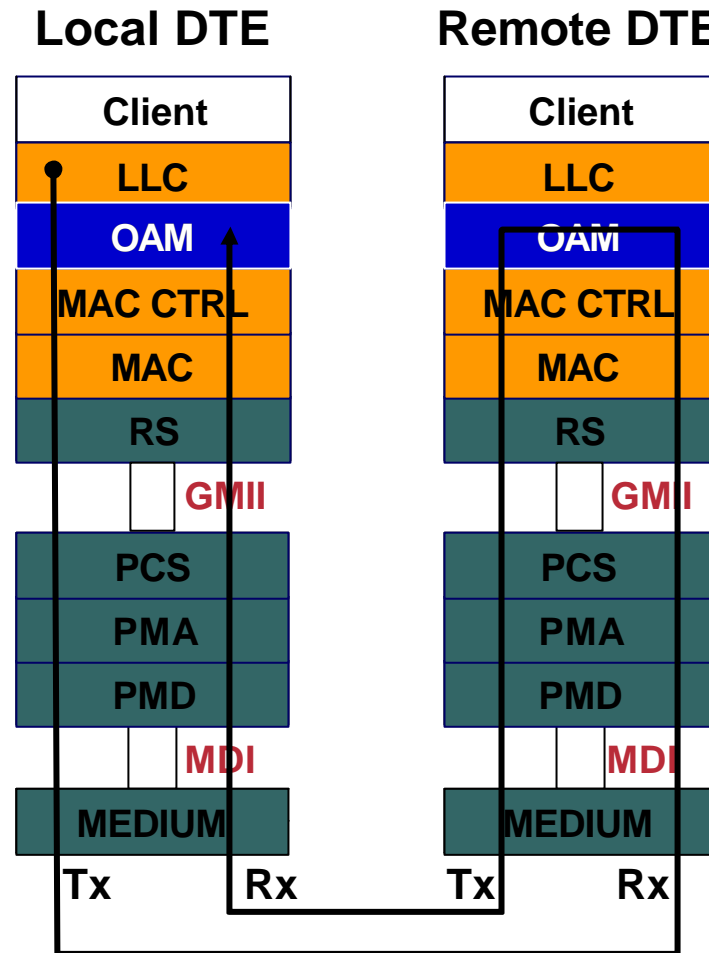

Cisco.com

- Dynamic Routing
- OAM

# OAM Remote Loopback

- Local DTE sends arbitrary data frames
- Remote DTE returns data frames
- 

Can be implemented in H/W or S/W

# OAM Discovery

- **Allows local DTE to detect OAM on remote DTE**
- **Once OAM support is detected, both ends of the link exchange state and configuration information**
  - e.g. mode, PDU size, loopback support
- **If both DTEs are satisfied with settings, OAM is enabled on link**
- **Loss of link and non-reception of PDUs for 5 seconds are causes of Discovery re-starting**

# Ethernet Ping

- Verifies all aspects of an Ethernet service, end-to-end
- Verifies valid packet sizes
- Measures round-trip delay
- Uses 802.3ah OAM in band

Ethernet Ping Enables Rapid Traffic Verification and Problem Isolation

# IEEE 802.1ad Updates

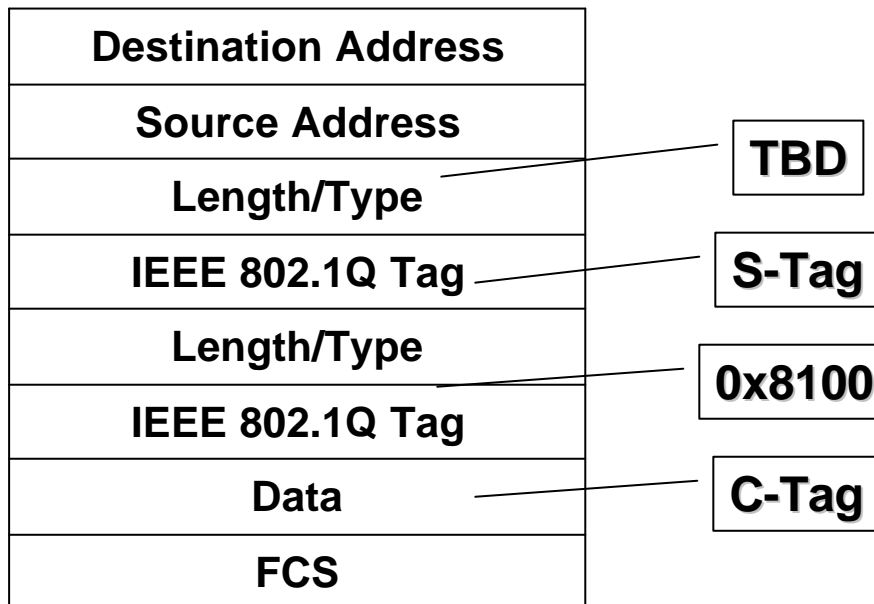

# Firm Directions

Cisco.com

- **Double Tag Format**
- **New Well Known MAC Addresses**
- **Layer Control Protocol Handling**
- **“Complex” UNI**

# New Tag EtherType

## MAC Frame

**S-Tag stands for Service Tag (formerly P-Tag for Provider Tag)**

# Provider Well Known MAC Addresses

Cisco.com

- **Originally thought was 33 new addresses**
- **Agree now that Provider Well Known Addresses will be in the existing BPDU block, 01:80:C2:00:00:xx**
- **Result is that Provider Layer 2 Control Protocols can not tunnel through a Subscriber's bridged network**

# Well Known Address Notes

Cisco.com

- **General Agreements**

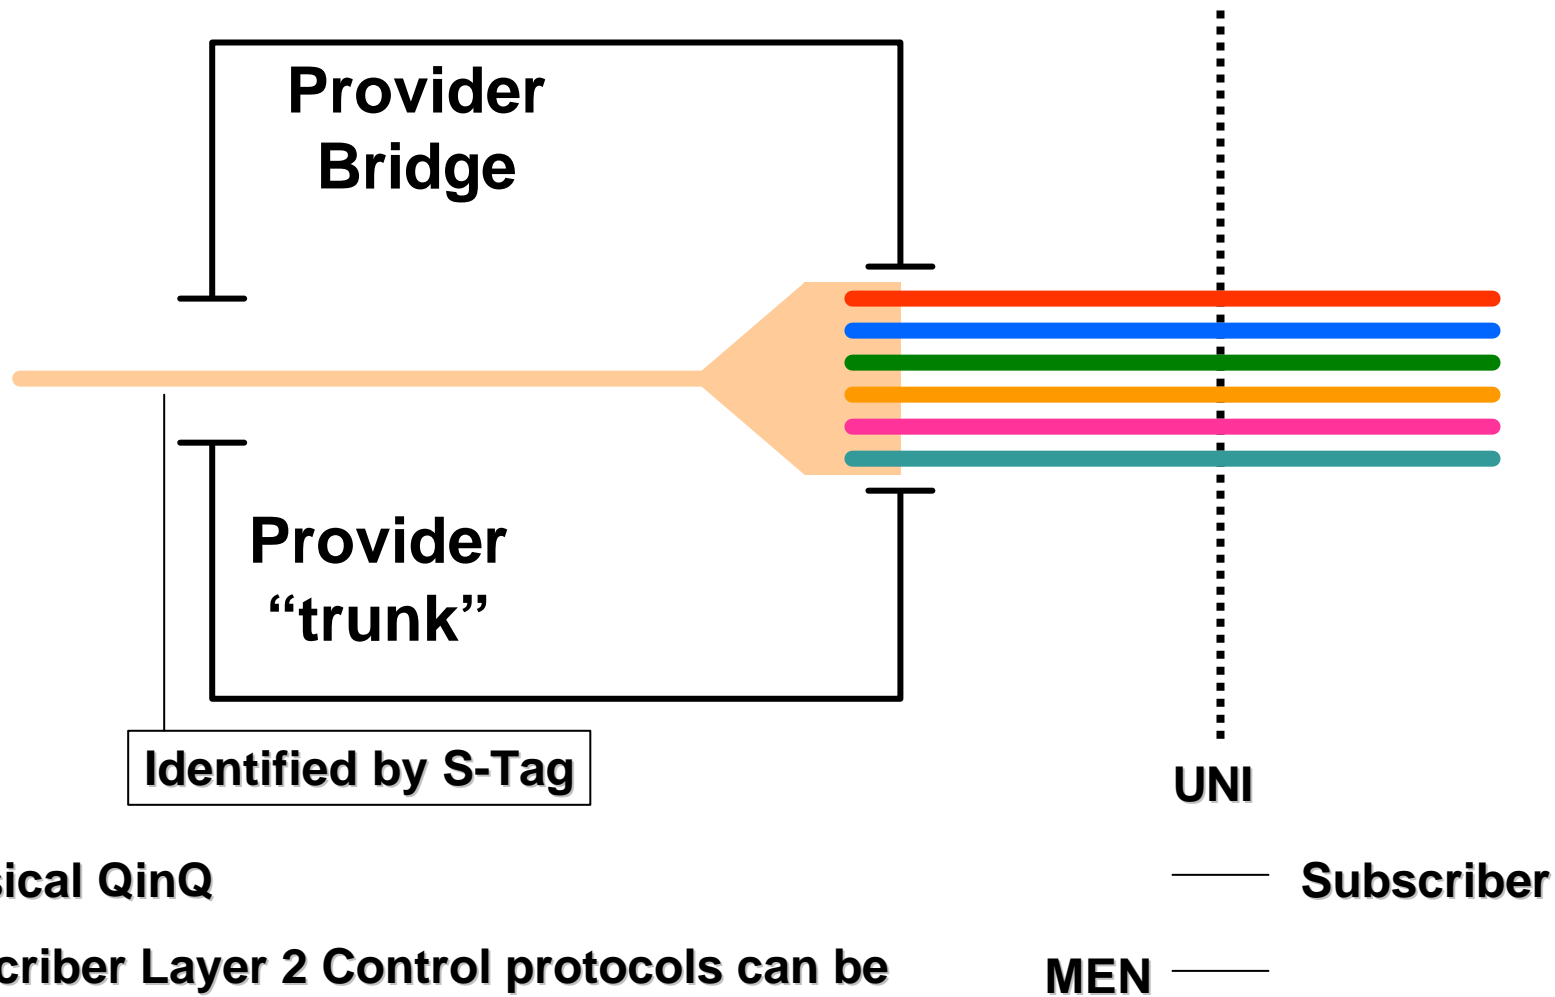

**802.3X (Pause Frames) and Slow Protocols  
(EFM, Link Aggregation) will not be tunneled**

# Model for Edge Bridge

- **Model to explain allowed behavior**
- **Implementation must match model behavior not model structure**
- **Constrains some features relative to MEF**
- **Enables new features relative to MEF**
- **Details still to be worked out, e.g., dealing with .1p bits in C-Tag**

# Model of Single Service UNI

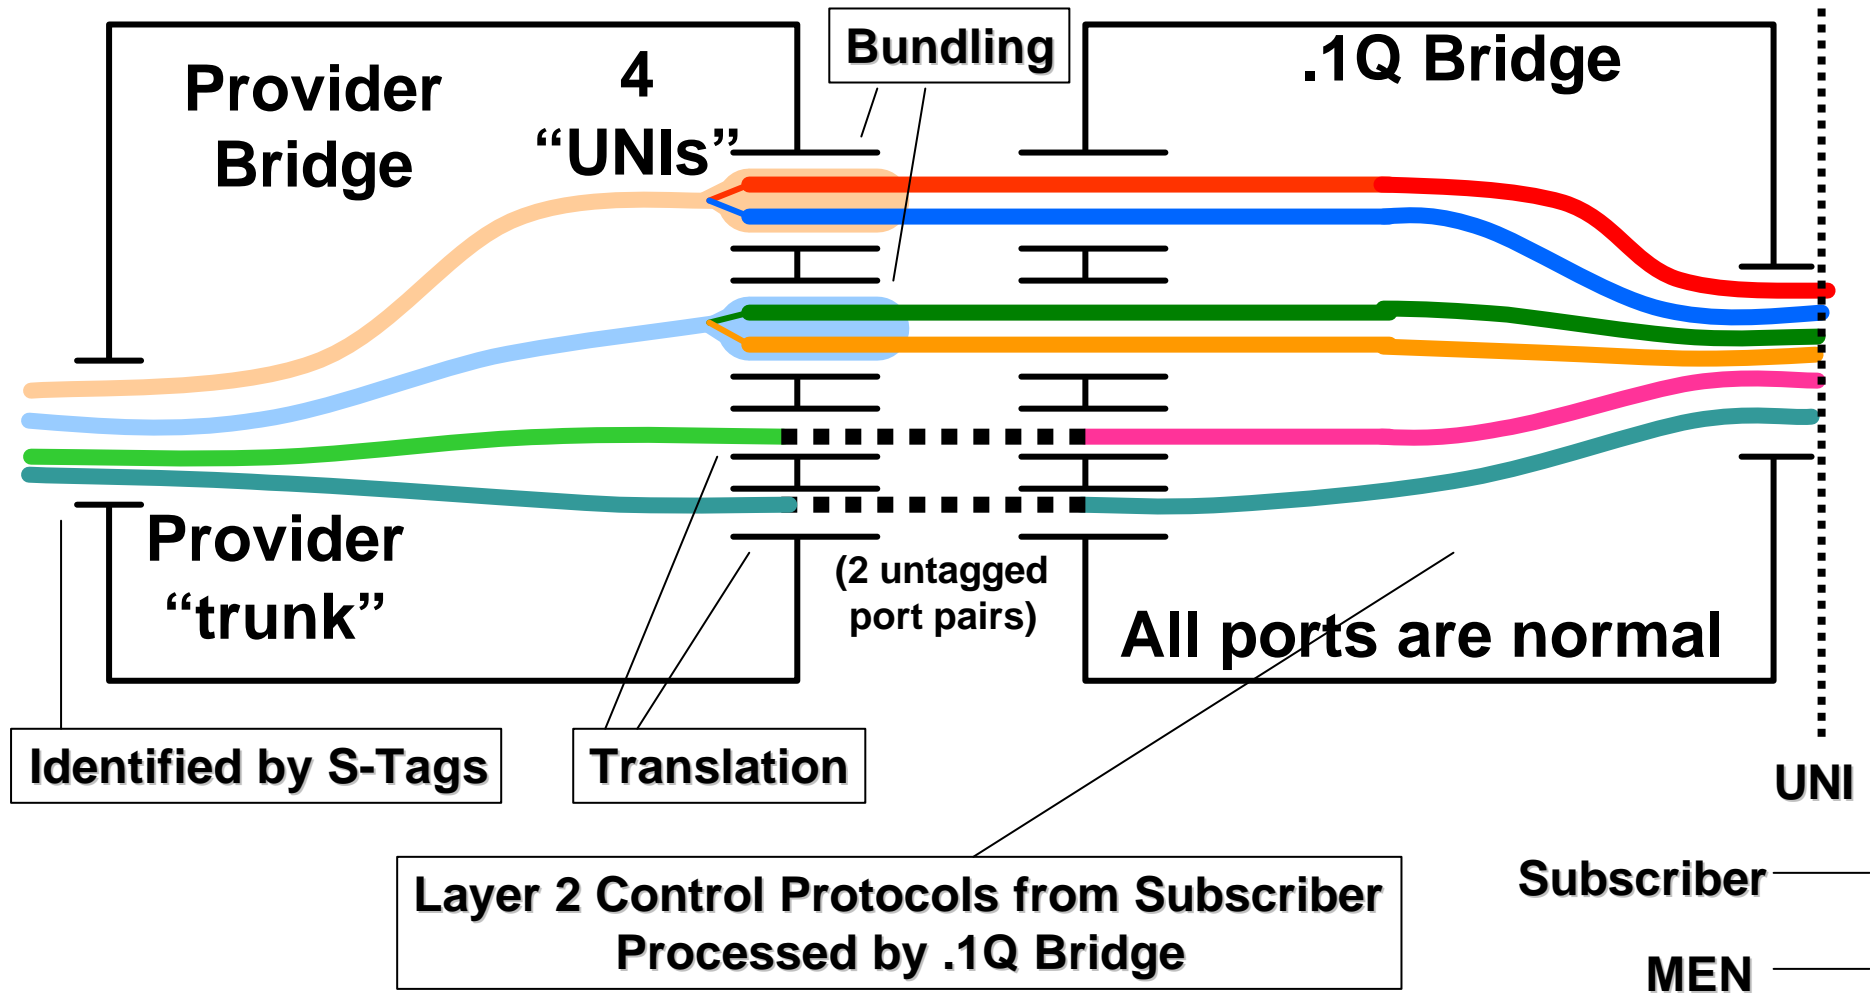

Cisco.com

- Classical QinQ
- Subscriber Layer 2 Control protocols can be tunneled as data

# Model of Multiple Service UNI

Cisco.com

# Notes on Multiple Service UNI

- **No Layer 2 Control Protocol tunneling**
- **MEN participates in Layer 2 Control Protocols, e.g., Subscriber's Spanning Tree Protocol**
  - Robust way to prevent loops when CE is a bridge**
  - Probably need to discard in .1Q Bridge to prevent participation**
- **Links between Provider Bridge and .1Q Bridge will be virtual in an implementation**

# Metro Ethernet Services

# Ethernet Relay Service (ERS)

- Logical Port to Logical Port
- Analogous to Frame Relay Service
- Well Defined Service Model

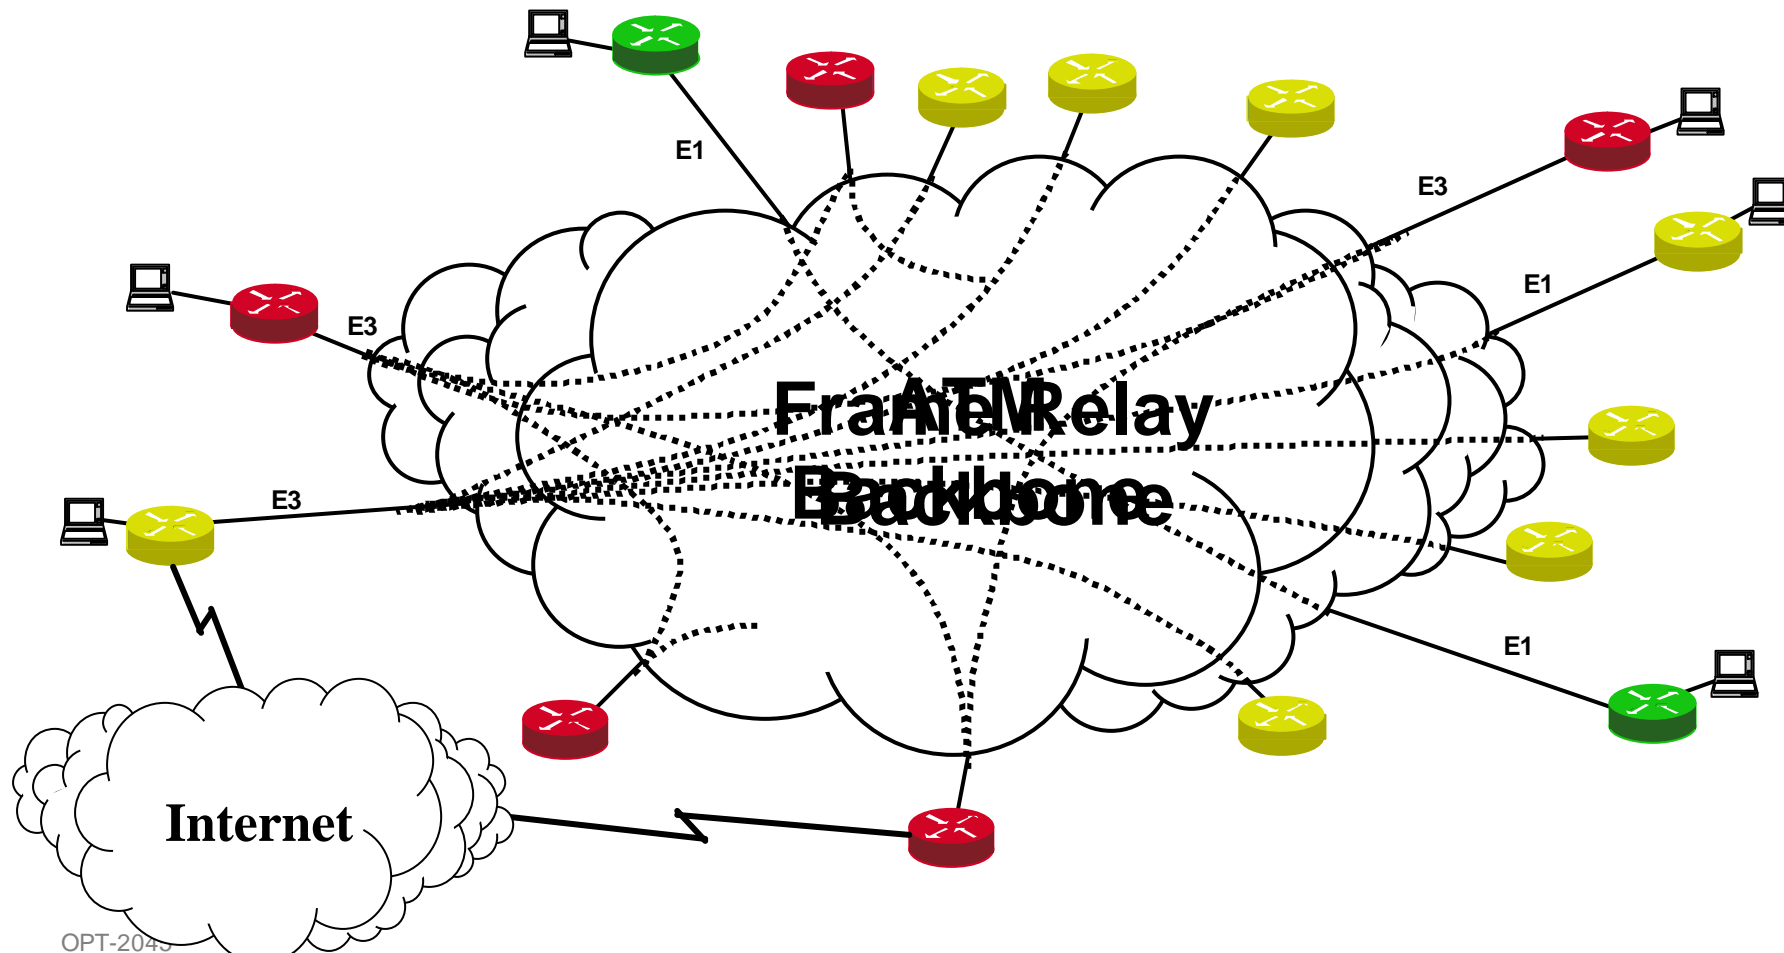

**Frame Relay Service**

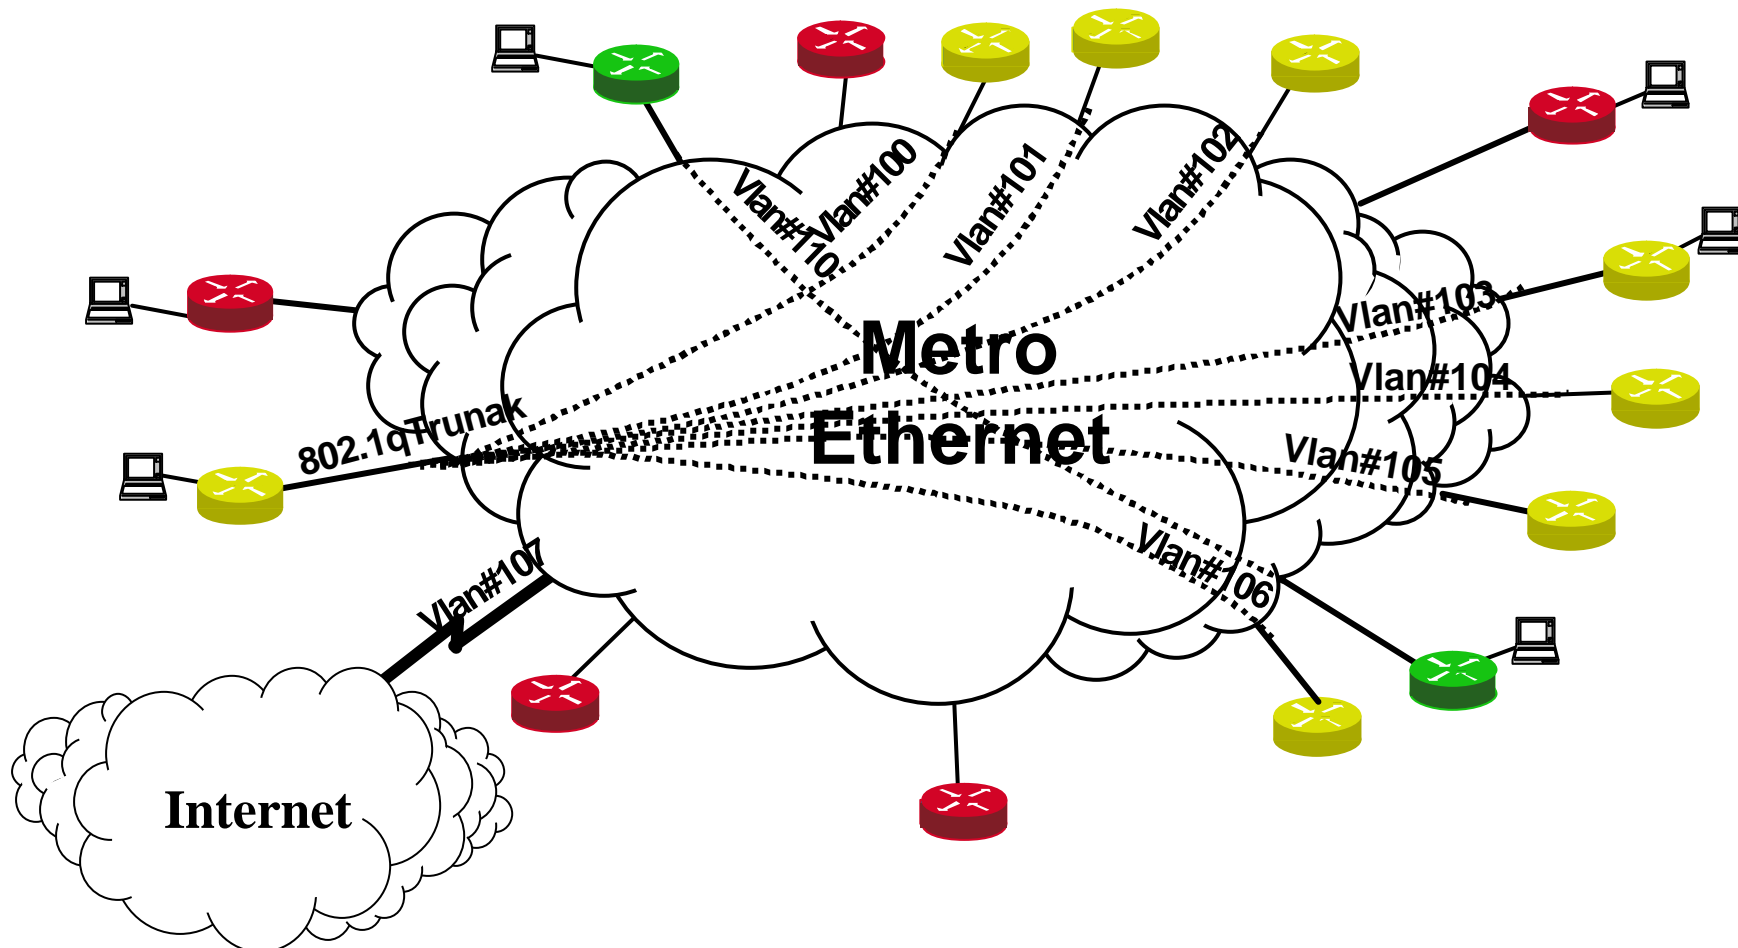

**Ethernet Relay Service**

# Typical Enterprise Network Architecture

# Ethernet Relay Service

# CPE Considerations - ERS and L2 Switches

Cisco.com

- ERS is a VLAN service **opaque** to L2 PDUs
- L2 CPE must use VLAN IDs determined by SP
- **STP loops** cannot be detected in the presence of “Backdoors”
- A “**Backdoor**” could be a service from another SP
- In a loop-free scenario:
  - **STP domain partitioned**, one root on each side
  - VTP advertisements will not flow end-to-end

# CPE Considerations – ERS Valid Combinations

- ERS is mainly **intended for L3 CPEs** or any other scenarios where L2 PDU transparency is not required
- SP should protect the UNI against un-expected L2 PDUs
- L2 CPE to L3 CPE is another valid combination

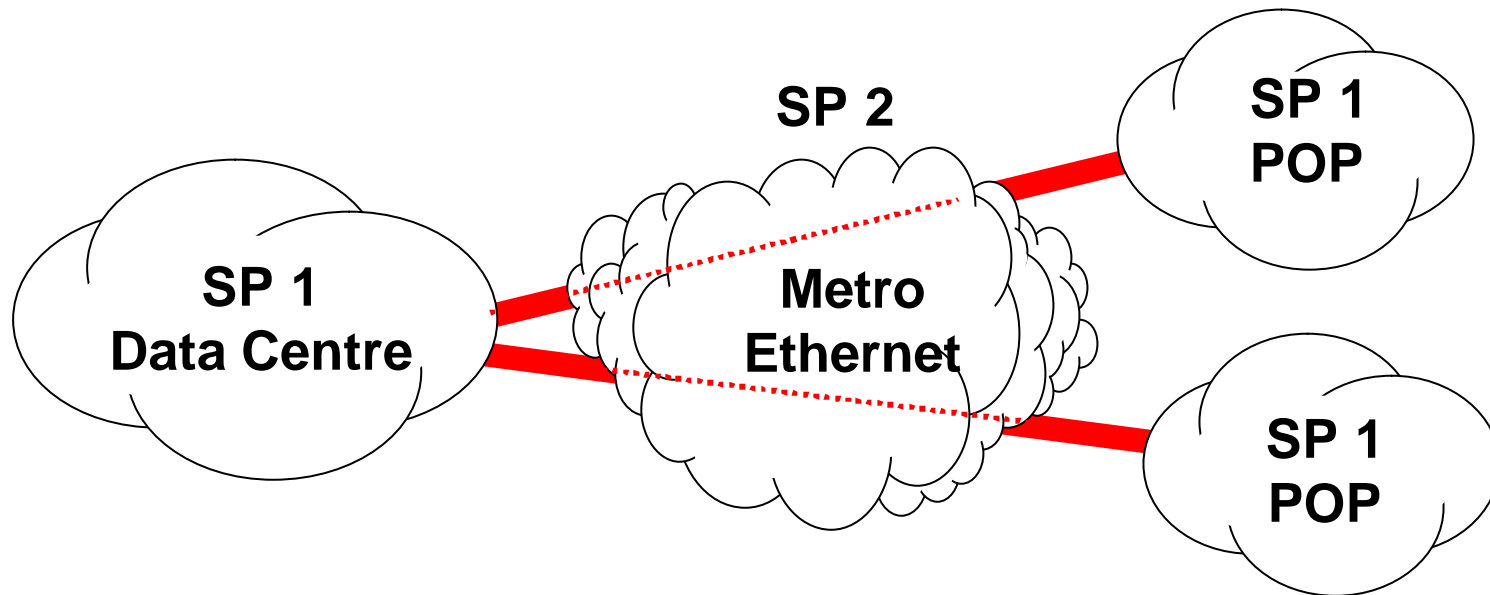

# Ethernet Wire Service (EWS)

Cisco.com

- Defines a **point-to-point, port-based** service
- **No service multiplexing** – “all-to-one” Bundling
- **Transparent** to customer BPDUs
- **Routers and switches can safely connect**

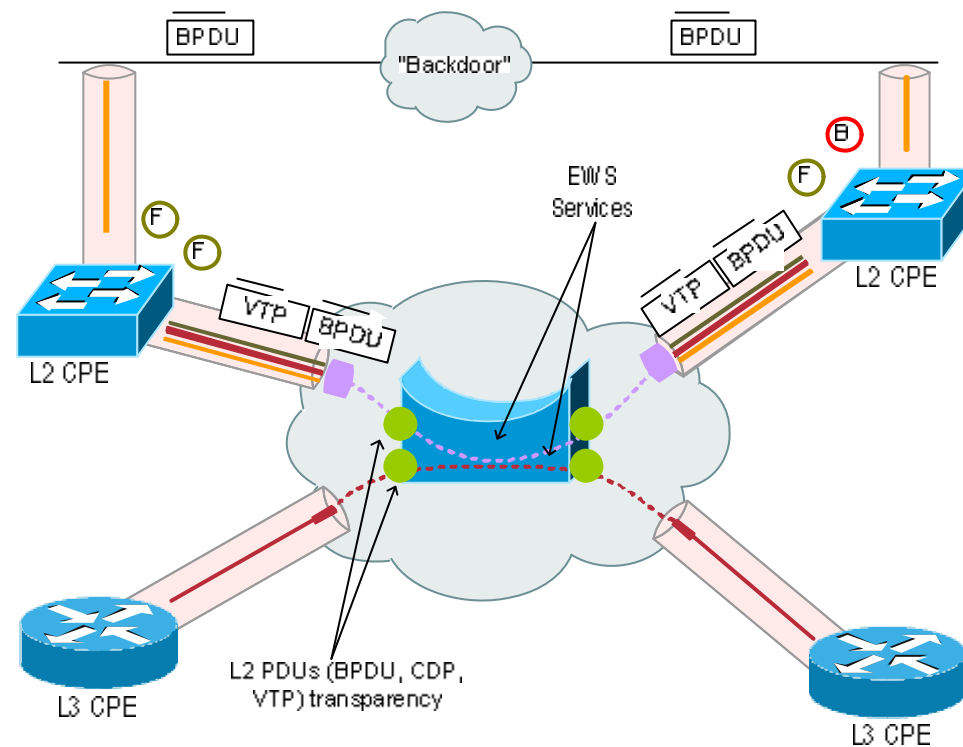

# Ethernet Wire Service Example

# CPE Considerations— EWS Valid Combinations

- EWS is a port based service with **L2 PDU transparency**
- **External loops** can be detected by the end devices
- **Both L2 and L3 CPEs** can be connected to an EWS UNI

# Ethernet Multipoint Service (EMS)

Cisco.com

- **Multipoint** service where all devices are direct peers
- **No service multiplexing**—all VLANs are presented to all sites (“all-to-one” bundling)
- **Transparent** to customer BPDUs
- **Routers and switches can safely connect**

## Multicast Scaling Issues

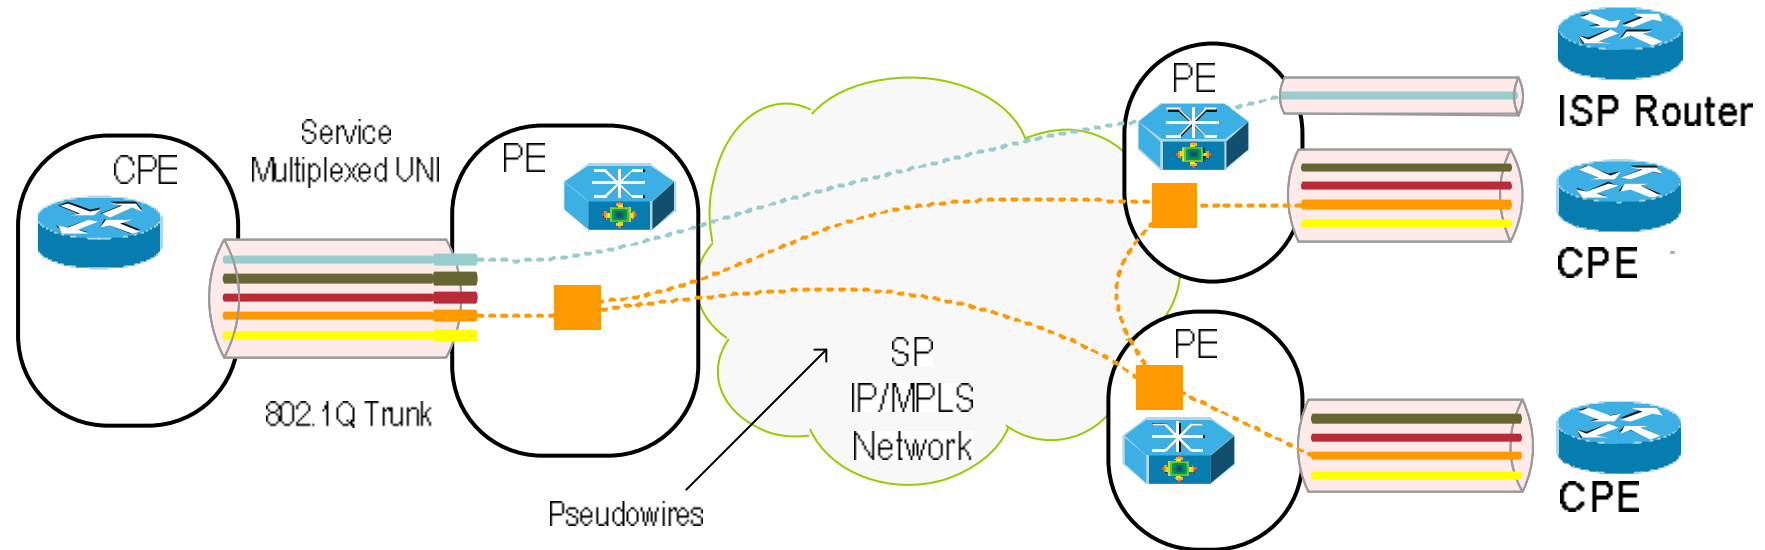

# Ethernet Multipoint Service Example

Cisco.com

# Ethernet Relay Multipoint Service (ERMS)

Cisco.com

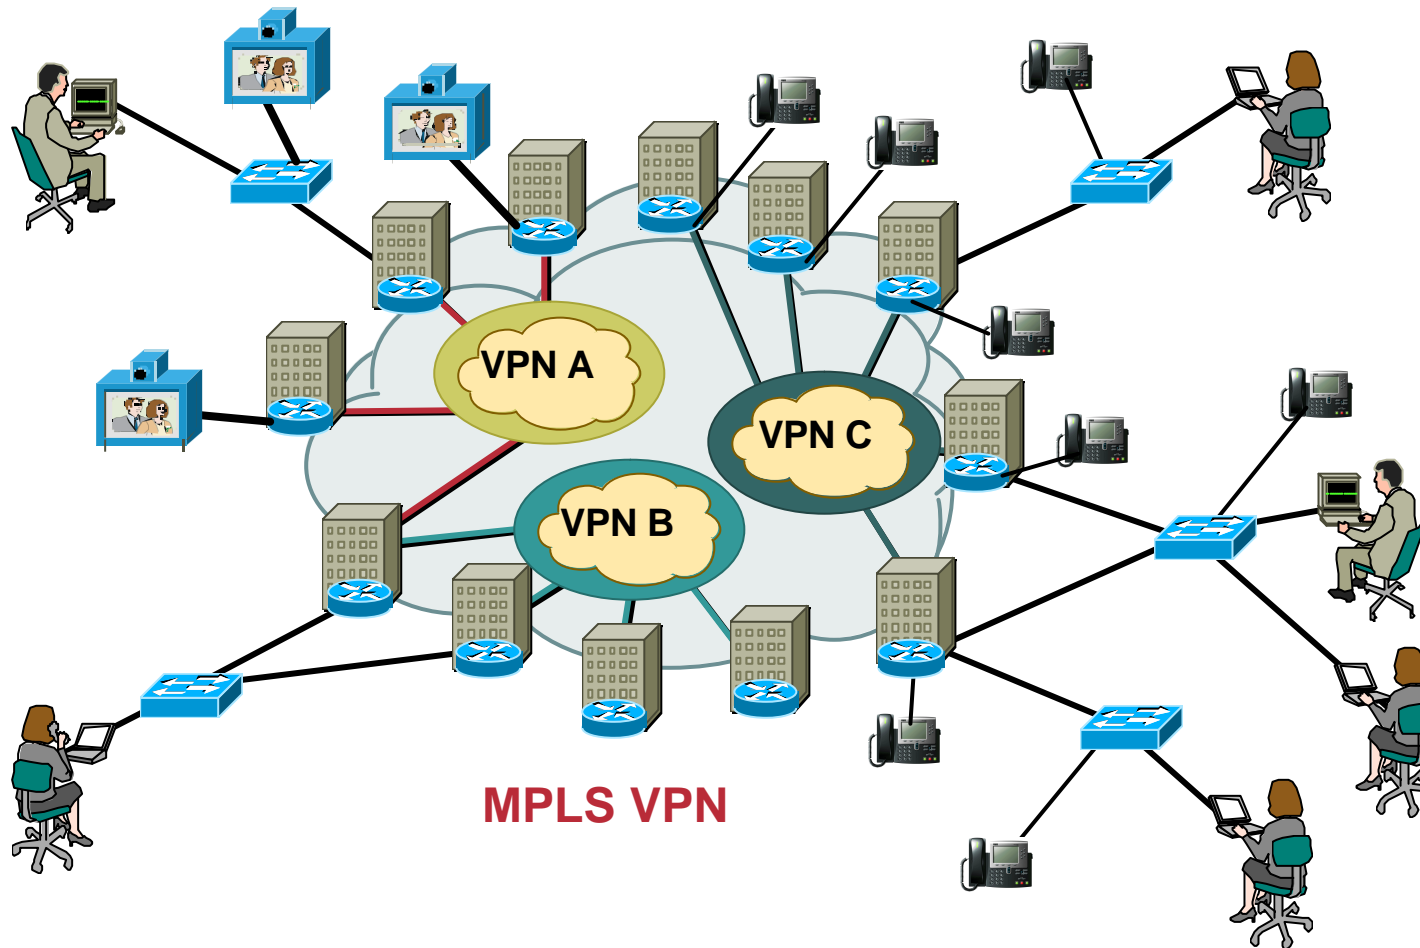

- Both **P2P** and **MP2MP** Services can coexist on the same UNI
- **Service multiplexed** UNI (e.g. 802.1Q trunk)
- **Opaque** to customer PDUs (e.g. BPDUs)
- **Routers can safely connect to an ERMS UNI**

# L3 VPN Service

- **L3 MPLS VPN Service**
  - Scalable Any-to-Any connectivity
  - Internet & Intranet
  - Managed & Unmanaged Service

# L3 VPN Applications

# MPLS Services

# Metro Ethernet Architecture

# Switch based Metro Ethernet Network

Cisco.com

- **Pros**

- Relatively inexpensive**

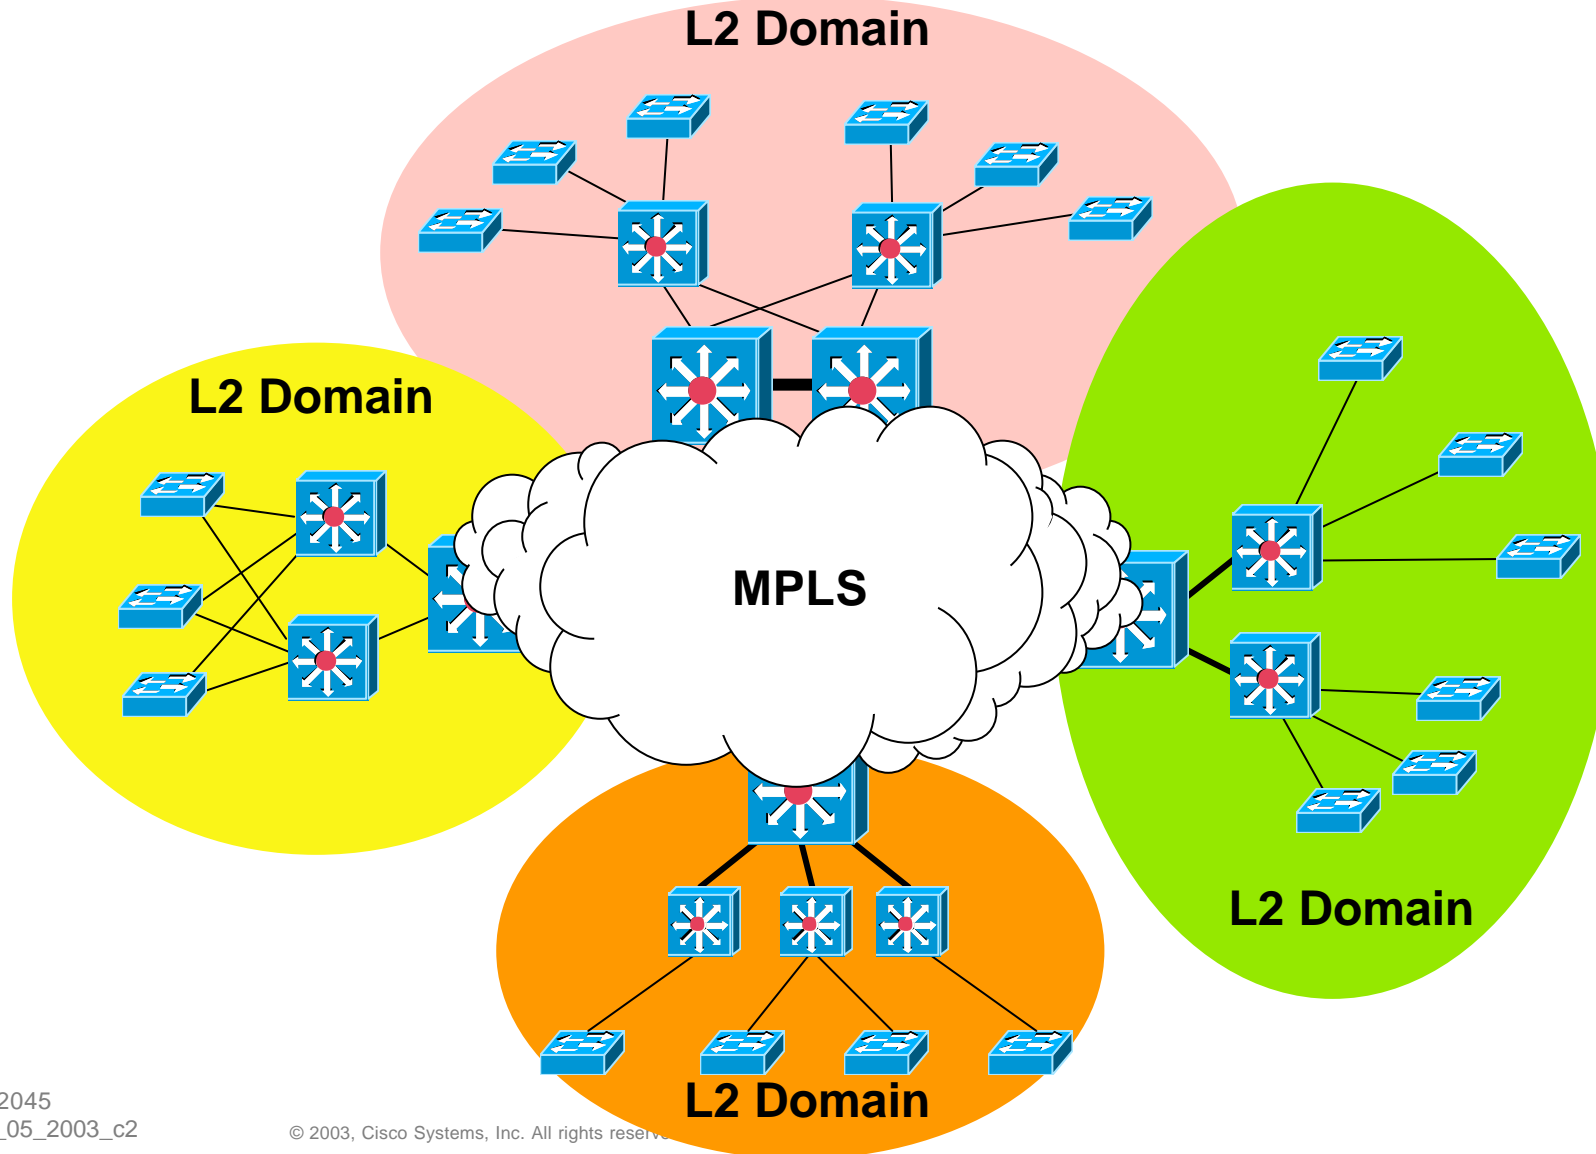

- Simple, easy to build**

- **Cons**

- 4K VLAN ID limitation**

- Scaling issue – Spanning tree**

# Scaling the Network – MPLS

# Basic MPLS

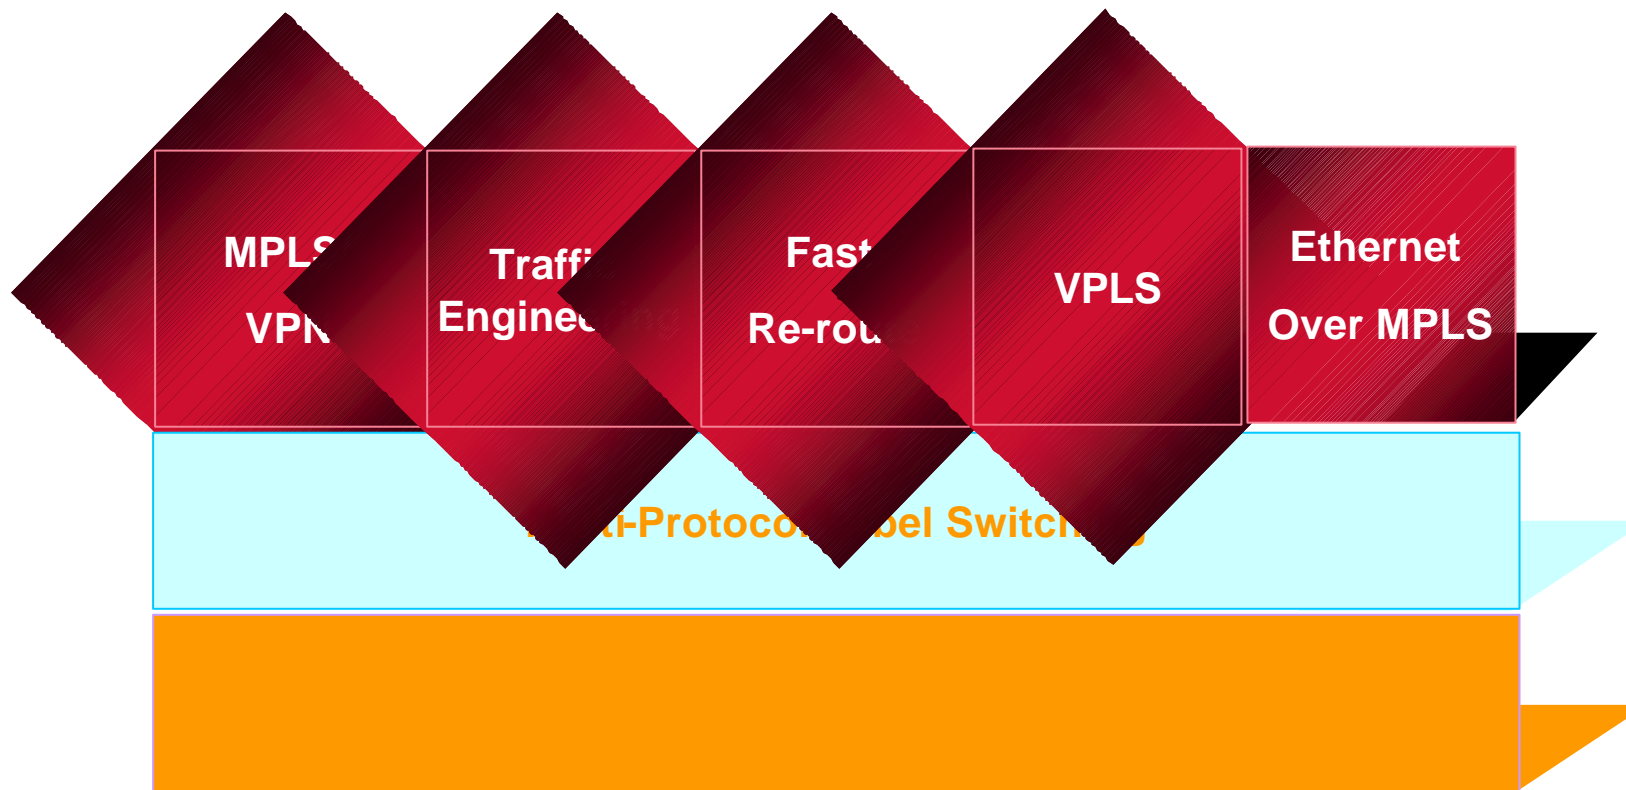

- **Solve ISP peering problem**
- **Same as IP routing**
- **No VPN Services**
- **MPLS routers/switches**

**Label Distribution Protocol**

**IS-IS or OSPF**

# MPLS as a Foundation for Value Added Services

# MPLS Components

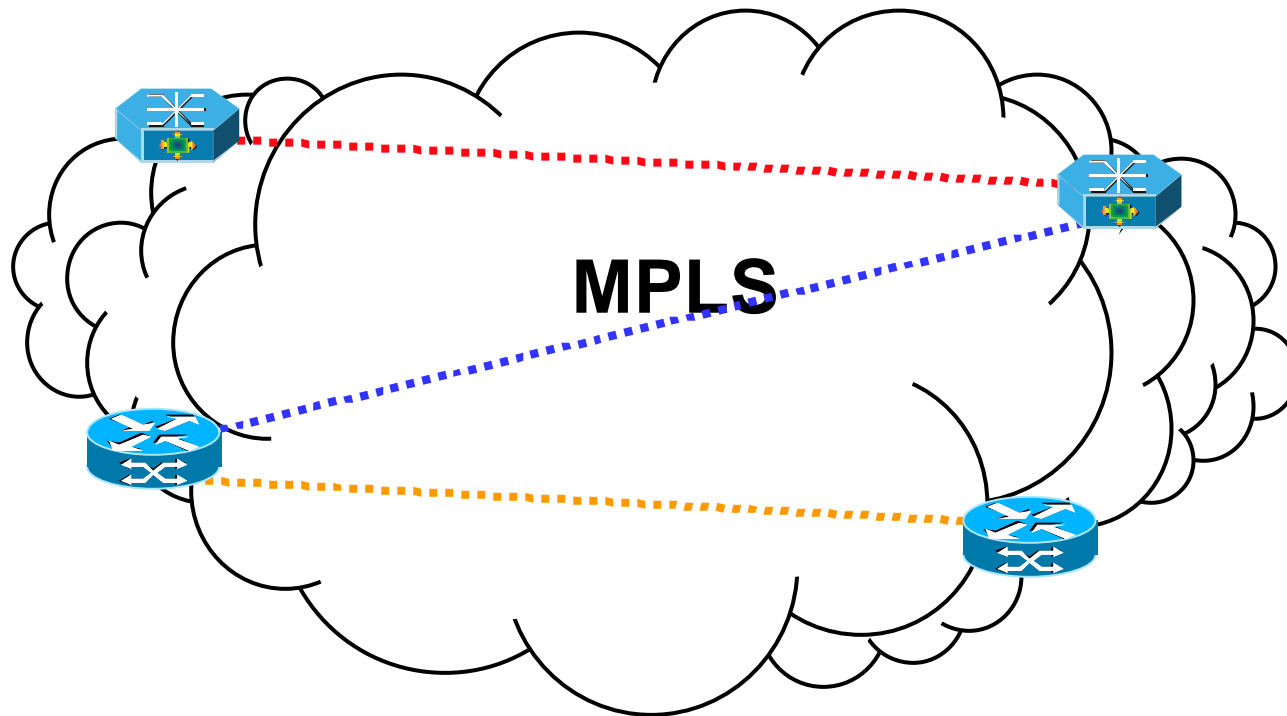

# EoMPLS - Draft-martini

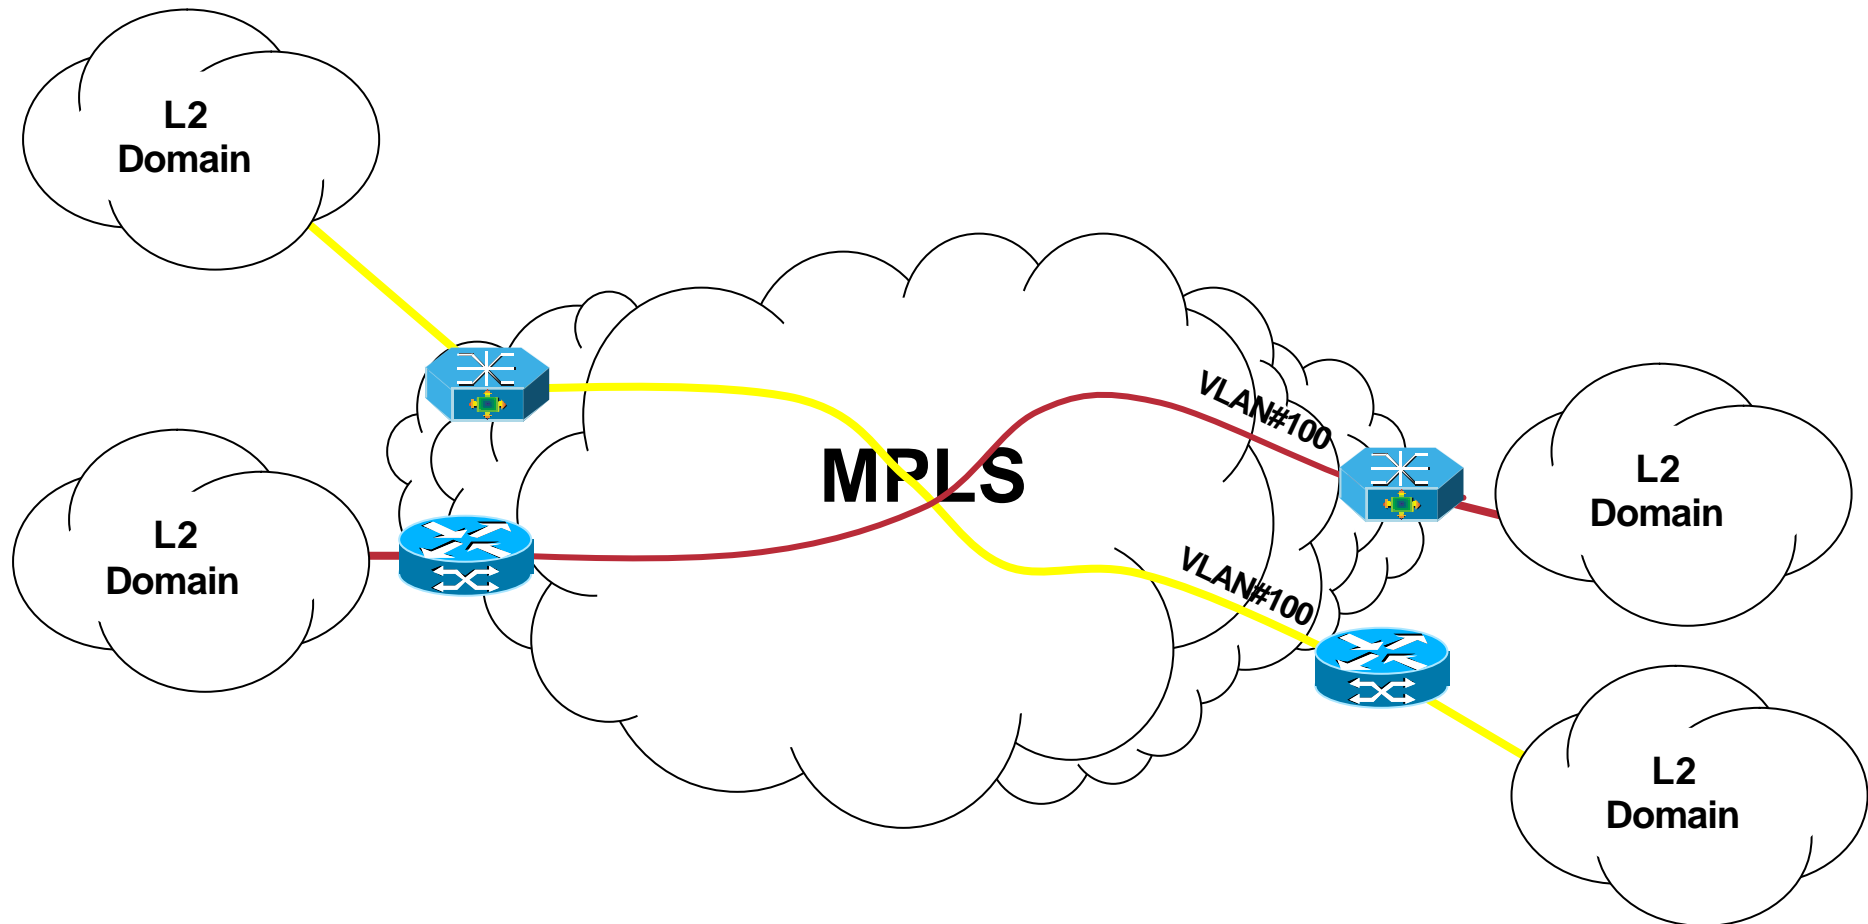

**The basic idea is to tunnel L2 packets through the MPLS cloud using an LSP tunnel**

**A Layer 2 “circuit” is allocated a label and LDP is used to distribute the label-circuit mapping.**

# Ethernet Over MPLS (EoMPLS)

# Ethernet Over MPLS (EoMPLS)

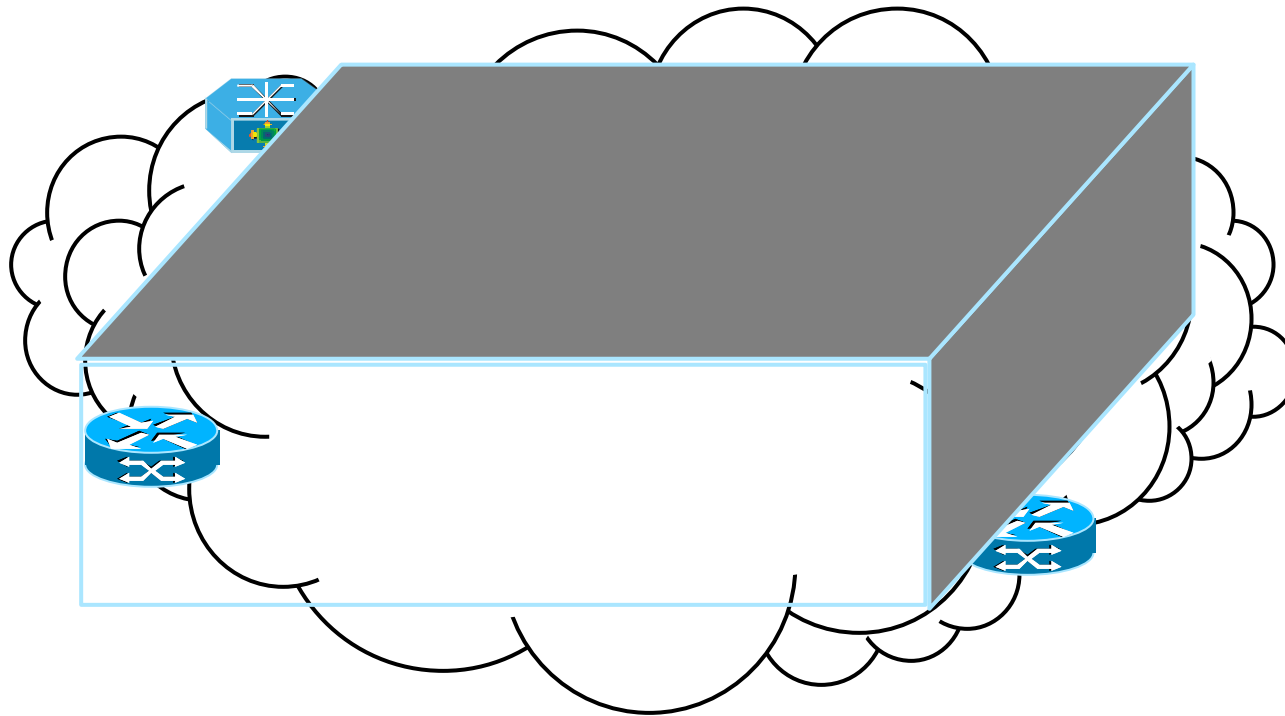

# What is VPLS?

- **A Virtual Private LAN Services (VPLS) is a multipoint Layer 2 VPN that connects two or more customer devices using Ethernet bridging techniques**
- **VPLS is an ARCHITECTURE defined within IETF**
- **A VPLS emulates an Ethernet Switch with each EMS being analogous to a VLAN**

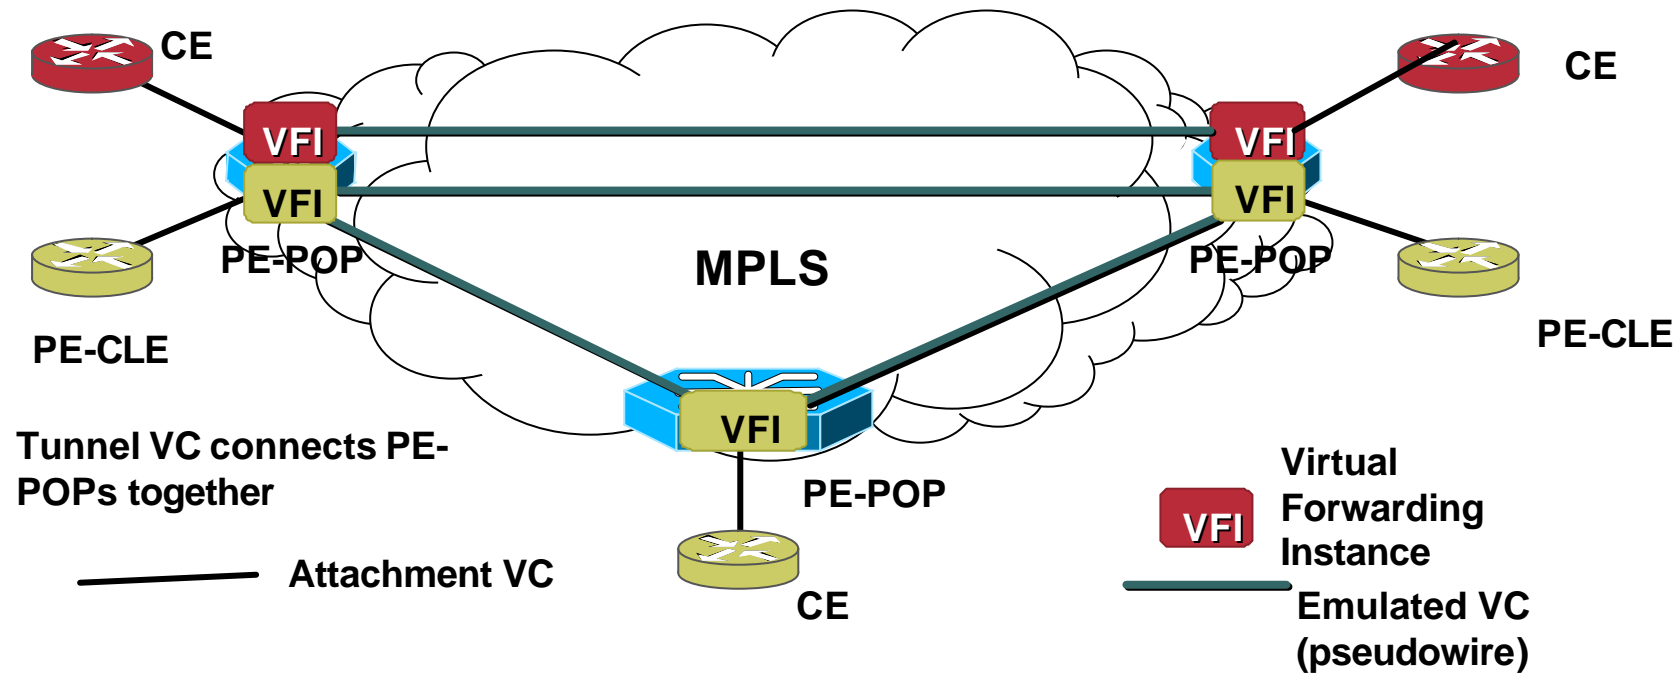

# VPLS

# How VPLS works

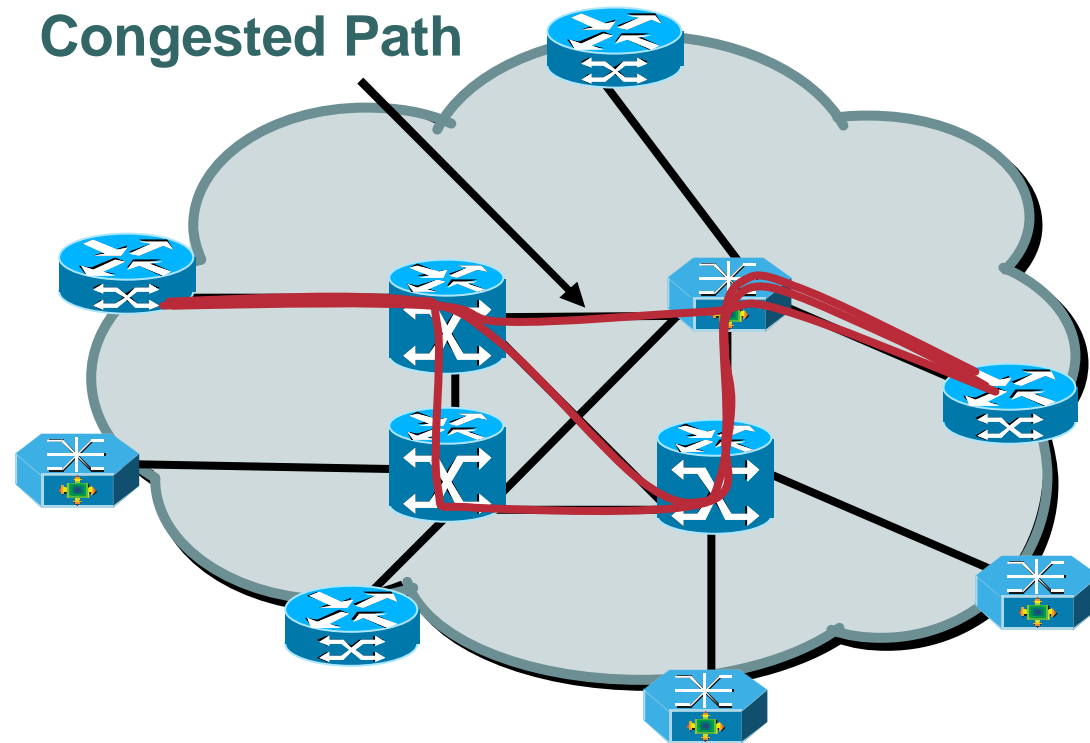

- **A VPLS essentially emulates an Ethernet switch from a users perspective**
  - All connections are peers within the VPLS and have direct communications**
- **The architecture is actually that of a distributed switch**
- **A VPLS forwards frames based upon bridging techniques**
  - Self learns Source MAC to Port Associations**
  - Floods unknown destination addresses, broadcast and multicast packets**
- **A VPLS does not run Spanning tree**

# VPLS

- **VPLS runs on the PE-POP's and acts as an overlay on the MPLS Core providing Multipoint Capabilities**

# MPLS Traffic Engineering

# MPLS VPN

## Overlay VPN

- Frame Relay/VC privacy
- VC-based
- Frame Relay/ATM aware
- groups endpoints

## MPLS-Based VPNs

- Network privacy
- Network-based (subnets)
- IP and VPN-aware
- groups users and services

# MPLS-VPN Benefits

- **Any-to-Any connectivity**
- **Interworks with legacy infrastructure**
- **Overlapping IP address space**
- **No VLAN ID coordination**
- **QoS**

# CISCO SYSTEMS

EMPOWERING THE  
INTERNET GENERATION
